

Plan the system around your site

Security, connectivity and building-system choices in Kuching and Sarawak

Start with the operating need

Choose the place you operate and the outcome you need: useful recordings, controlled entry, a warning at an agreed boundary, reliable connectivity or support for an existing installation.

This guide introduces the website's planning routes. The detailed pages explain functions, site conditions and the scope to confirm. Illustrations are conceptual system views.

Choose CCTV functions clearly

Architecture, camera response and independent alarm control

Architecture

Coax cameras and a DVR, IP cameras with network/PoE and an NVR, and selected Wi-Fi camera arrangements are different connection designs. Wi-Fi data still needs an appropriate power arrangement.

Everyday recording

Essential focuses on viewing, recording and later review. Coverage, storage and authorised access follow the actual site.

Audio and camera warning

Wired Interactive has a supported conversation path. Interactive Pro's approved audio description is microphone listen-in. Proactive plans selected camera-side talk, sound and light functions.

Independent alarm control

Defence adds the reference alarm panel, keypad and separate siren. Having both systems and having a configured, tested event link are separate things.

Pro and Plus

Pro identifies HJ's IP/NVR/PoE family. Plus is a specified processing, event-function and optional-output upgrade direction. Exact supported functions and operating capacities follow the selected equipment and configuration.

Match the plan to the place

Different sites need different areas, routines and responsibilities

Home

Review the front approach, private boundary, side access and garden. Agree at-home, away and night routines, including testing with the actual family dog where relevant.

[Read the relevant site guide >](#)

Office

Separate ordinary office hours, reception, staff routes and restricted rooms. Coordinate CCTV, access, network and authorised review.

[Read the relevant site guide >](#)

Retail and hospitality

Consider counter activity, stock or service doors, public circulation, closing routines and who reviews an event.

[Read the relevant site guide >](#)

Factory and warehouse

Plan shift entry, perimeter review, loading activity, realistic viewing obstructions and the agreed recording or response workflow.

[Read the relevant site guide >](#)

Schools, healthcare and other sites

Use the site's approved areas, operating schedules and review permissions. Each industry page describes its own planning questions.

Prepare a useful enquiry

Installation, system improvement, repair or maintenance

New installation or upgrade

Describe the site, important areas, required functions, existing equipment and any available plans. HJ can review the combination, interfaces and handover requirements.

Repair or troubleshooting

Include the system involved, equipment model labels, the symptom and when it occurs. Examples include offline cameras, missing recordings or an access device that does not respond.

Maintenance or AMC

Identify the installed systems and what should be inspected, tested and recorded. The service and maintenance pages explain the available routes and the scope to agree.

Brand and model information

Use the brand directory to find related published guides. A brand name alone does not establish every model's capability or integration path.

Contact HJ

Use the website assessment form to share the relevant details, or continue the discussion on WhatsApp at +60 16-886 8115.
